

# Module description

for the degree programme

Master of Science Advanced  
Optical Technologies

(Version of examination regulation: 20222)

for the winter term 2024/2025

# Table of contents

Fundamentals of Optics (42101).....	4
Basics of Laser (42105).....	6
Numerical Methods and Topics in Optical Technologies (42110).....	8
Project report (1994).....	10
Optical Metrology	
Thermophysical properties of working materials in process and energy engineering (44960).....	12
Product analysis (45370).....	16
Optical technologies in life science (45730).....	18
Nonlinear optics (582360).....	21
Glass I (46228).....	23
Optical diagnostics in energy and process engineering (42935).....	25
Novel techniques in ultrafast spectroscopy (67009).....	28
Modern optics 1: Advanced optics (48311).....	30
Photon & neutron scattering for structure determination (94474).....	32
Optical Material Processing	
Advanced Laser (42130).....	36
Scanning and printing in 3D (46100).....	38
Engineering of solid state lasers (94930).....	40
Laser system technology I: High-power lasers for material processing: designs, basics of beam guidance and shaping, applications (95360).....	42
Laser technology (97150).....	44
Laser system technology II: Laser safety, integration of lasers in machines, control and automation technology (97283).....	46
Laser tissue interaction (763337).....	48
Optics in Medicine	
Photonics in Medical Engineering (42145).....	51
Optical technologies in life science (45730).....	52
Photonics for medical applications (47650).....	55
Laser tissue interaction (763337).....	57
Fundamentals in anatomy and physiology for engineers (47664).....	59
Magnetic resonance imaging 2 + exercise (568977).....	61
Magnetic resonance imaging (122337).....	63
Photonics in medical technology (47624).....	64
Find the disease Case based teaching (746003).....	66
Biophysics of Cellular Building Blocks (67094).....	67
Optics in Communication	
Modern optics 3: Quantum optics (48313).....	70
Advanced nonlinear optics (67143).....	71
Waveguides, optical fibres and photonic crystal fibres (67145).....	73
Quantum communication (67188).....	75
Linear and non-linear fibre optics (267499).....	76
Nonlinear optics (582360).....	78
Advanced optical communication systems (621649).....	80
Arduino hardware and software for lab applications and beyond (67111).....	82
Introduction to quantum communication (67092).....	84
Optical Materials and Systems	
Advanced Laser (42130).....	87
Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	89

Thermophysical properties of working materials in process and energy engineering (44960).....	91
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	95
Waveguides, optical fibres and photonic crystal fibres (67145).....	97
Modern optics 1: Advanced optics (48311).....	99
Glass I (46228).....	101
Glass II (46229).....	103
Photovoltaic systems - Fundamentals (42923).....	105
Photovoltaics (PV) and PV Systems II: Light conversion and light management (46253).....	107
Nonlinear optics (582360).....	110
Advanced nonlinear optics (67143).....	112
Ceramic materials: Processing and properties (46222).....	114
Lab courses major topic 1+2	
Laboratory course: Optics in medicine (42725).....	117
Laboratory course: Physics of light (42730).....	118
Computational Optics	
Computational photography and capture (43386).....	120
Pattern analysis (44120).....	122
Pattern recognition (44130).....	125
Computer vision (713618).....	127
Quantum computing (67156).....	129
Computational visual perception (93173).....	131
Implementations of Quantum Error Correction (67016).....	133
Physics of Light	
Advanced Laser (42130).....	136
Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	138
Modern optics 3: Quantum optics (48313).....	140
Advanced nonlinear optics (67143).....	141
Quantum computing (67156).....	143
Quantum communication (67188).....	145
Nonlinear optics (582360).....	146
Novel techniques in ultrafast spectroscopy (67009).....	148
Introduction to quantum communication (67092).....	150
Related Fields	
Introduction to machine learning (65718).....	153
Methods of data analysis I (67172).....	156
Machine learning for engineers I - Introduction to methods and tools (95067).....	158
Machine learning for engineers II: Advanced methods (95068).....	160
Machine learning for physicists (668977).....	162
Deep learning (901895).....	164
Advanced experimental physics (66941).....	166
Advanced theoretical physics (66961).....	169
Functional analysis for engineers (43230).....	172
Data science survival skills (47677).....	173
Advanced Programming Techniques (44171).....	175
Elements of Artificial Intelligence for Scientific Discovery (67141).....	177

1	<b>Module name</b> 42101	<b>Fundamentals of Optics</b>	<b>15 ECTS</b>
2	Courses / lectures	Vorlesung mit Übung: Fundamentals of Optics (10 SWS)	15 ECTS
3	Lecturers	Ziwen Zhai Prof. Dr.-Ing. Andreas Paul Fröba Wenchang Wu	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Andreas Paul Fröba	
5	<b>Contents</b>	<ul style="list-style-type: none"> <li>• A Brief History</li> <li>• Wave Motion: One-Dimensional Waves, Harmonic Waves, Phase and Phase Velocity, Superposition Principle, Complex Representation, Plane Waves, Three-Dimensional Wave Equation, Spherical Waves, Cylindrical Waves</li> <li>• Electromagnetic Theory, Photons, and Light: Farady's Induction Law, Gauss's Law, Ampère's Circuital Law, Maxwell's Equations, Transverse Waves, Energy and Momentum, Averaging Harmonic Functions, Radiance and Irradiance, The Inverse Square Law, Photon Counting, Radiation Pressure and Momentum, Electric Dipole, Light in Bulk Matter, Dispersion, The Electromagnetic-Photon Spectrum,</li> <li>• The Propagation of Light: Rayleigh Scattering, Scattering and Interference, The Transmission of Light Through Dense Media, Transmission and the Index of Refraction, Reflection, Refraction, Huygens's Principle, Fermat's Principle, Electromagnetic Approach, Fresnel Equations, Total Internal Reflection, Evanescent Wave, Optical Properties of Metals, Stokes Treatment of Reflection and Refraction, Photons, Waves, and Probability, Quantum Electrodynamics,</li> <li>• Geometrical Optics: Lenses, Refraction at Spherical Surfaces, Thin Lenses, Finite Imagery, Thin Lens Combinations, Apertures and Field Stops, Entrance and Exit Pupils, Relative aperture and f-Number, Mirrors, Prisms, Fiberoptics, Human eye, Magnifying Glasses, Compound Microscop, Camera, Telescope, Wavefront Shaping, Thick Lenses and Lens Systems, Analytical Ray Tracing, Aberrations,</li> <li>• Superposition of Waves: Addition of Waves, Standing Waves, Anharmonic Periodic Waves, Nonperiodic Waves,</li> <li>• Polarization: The Nature of Polarized Light, Polarizers, Dichroism, Birefringence, Polarization by Reflection, Retarders, Optical Modulators, Mathematical Description,</li> <li>• Interference: Conditions for Interference, Temporal and Spatial Coherence, Holographic Interferometry, The Fresnel-Arago Laws, Young's Experiment, Wavefront-splitting Interferometers, Dielectric Films – Double-Beam Interference, Michelson Interferometer, Mach-Zehnder Interferometer,</li> </ul>	

		<ul style="list-style-type: none"> <li>• Diffraction: The Huygens-Fresnel Principle, Fraunhofer and Fresnel Diffraction, Several Coherent Oscillators, Fraunhofer Diffraction, Fresnel Diffraction, Kirchhoff's Scalar Diffraction Theory</li> </ul>
6	<b>Learning objectives and skills</b>	<p>Students should be able</p> <ul style="list-style-type: none"> <li>• to describe and explain the experimental basics and the mathematical description of optic and quantum phenomena</li> <li>• apply laws of physics and mathematical methods to actual problems</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	<b>Method of examination</b>	Written examination (150 minutes)
11	<b>Grading procedure</b>	Written examination (100%)
12	<b>Module frequency</b>	Only in winter semester
13	<b>Workload in clock hours</b>	Contact hours: 150 h Independent study: 300 h
14	<b>Module duration</b>	1 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	Eugen Hecht: Optics

1	<b>Module name</b> 42105	<b>Basics of Laser</b>	<b>5 ECTS</b>
2	Courses / lectures	Praktikum: Basic of Lasers - Lab sessions (1 SWS) Vorlesung mit Übung: Basics of Laser (3 SWS)	1 ECTS 4 ECTS
3	Lecturers	Prof. Dr. Nicolas Joly Minjae Hong	

4	<b>Module coordinator</b>	Prof. Dr. Nicolas Joly
5	<b>Contents</b>	<p>Laser technology developed enormously since its first demonstration in 1960. Although at that time laser was described as "a solution in search of a problem it is nowadays used everywhere, from high-precision spectroscopy to bar-scanner in supermarkets, from eye-surgery to metal welding for car industry. The lecture focuses on the basics of laser and serves as a first glance in the fascinating world of coherent light sources. It reviews four major aspects of lasers:</p> <p>(i) the description of the active material, which provides the gain for the system  (ii) the laser cavity, which defines the spatial structure of the laser beam  (iii) the propagation of laser beam using the ABCD matrices formalism and  (iv) the different dynamical regimes of laser, in particular the way to generate pulses.</p> <p>Besides the lecture/exercises the students are invited to test the concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser.</p> <p>During lab exercises the students will work on concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser.</p>
6	<b>Learning objectives and skills</b>	<p><b>Students will be able to:</b></p> <ul style="list-style-type: none"> <li>• Describe the active material using the rate equations</li> <li>• Check the stability of a laser cavity and extract the beam parameters from the physical parameters of the cavity (length, radius of curvature of the mirrors etc.)</li> <li>• Use ABCD matrix to define the spatial properties of a laser beam and shape the beam (focusing, coupling etc.)</li> <li>• Align a laser cavity and observe the different spatial modes that can be generated</li> <li>• Understand the different dynamical behaviours of a laser (mode-locked laser, Q-switch laser, continuous).</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	<b>Method of examination</b>	Practical achievement Written examination (90 minutes)

		At the end of the course there is a written exam (90 min). In addition the students have to write reports about two lab sessions.
11	<b>Grading procedure</b>	Practical achievement (20%) Written examination (80%)
12	<b>Module frequency</b>	Only in winter semester
13	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
14	<b>Module duration</b>	1 semester
15	<b>Teaching and examination language</b>	english
16	<b>Bibliography</b>	"Laser by A.E. Siegman, University Science book, 1986  "Handbook of Lasers and Optics by F. Träger, Springer, 2007  "Les lasers by D.Dangoisse, D. Hennequin and V. Zehnlé)Dhaoui, Dunod 1998  "Principles of Lasers, 5th ed. by Orazio Svelto, Springer 2010

1	<b>Module name</b> 42110	<b>Numerical Methods and Topics in Optical Technologies</b>	<b>5 ECTS</b>
2	Courses / lectures	Vorlesung: Topics of Optical Technologies (2 SWS) Vorlesung: Numerical tools in optics (Matlab) (2 SWS)	2,5 ECTS 2,5 ECTS
3	Lecturers	Prof. Dr. Nicolas Joly Dr.-Ing. Florian Klämpfl Prof. Dr.-Ing. Bernhard Schmauß Prof. Dr. Christoph Pflaum Dr. Jürgen Grossmann Prof. Dr. Maria Chekhova Sebastian Schürmann Dr. Angela Perez Castaneda	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Bernhard Schmauß
5	<b>Contents</b>	The module introduces the topics which can be chosen as major topics in the second and third semester of MAOT and the use of the software Matlab (or another numerical tool for the analysis of data).
6	<b>Learning objectives and skills</b>	Students (part "Numerical...") <ul style="list-style-type: none"> <li>do understand the basic concept of Matlab</li> <li>do know the basic functions of Matlab</li> <li>are able to apply Matlab for solving numerical problems in the field of optics</li> </ul> (part "Topics...") <ul style="list-style-type: none"> <li>know different application fields of optical technologies</li> <li>are able to decide about their major topics for the second and third term</li> </ul>
7	<b>Prerequisites</b>	None
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	<b>Method of examination</b>	Course achievement Students have to <ul style="list-style-type: none"> <li>produce two presentations (15-25 page) about two of the seven majors as a group work (in groups of 4-6 students)</li> <li>do several small Matlab exercises (1-2 pages code) and a more comprehensive project (4-7 pages)</li> </ul> Both achievements are not graded.
11	<b>Grading procedure</b>	Course achievement (0%)
12	<b>Module frequency</b>	Only in winter semester
13	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
14	<b>Module duration</b>	1 semester
15	<b>Teaching and examination language</b>	english

1	<b>Module name</b> 1994	<b>Project report (M.Sc. Advanced Optical Technologies 20222)</b> Project report	<b>10 ECTS</b>
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Bernhard Schmauß	
5	<b>Contents</b>	The student undertake a research project of about 300 h and write a project report about it under the supervision of a professor of the university. It should preferably be written in one of the major topics of the student.	
6	<b>Learning objectives and skills</b>	<p>Students learn how to</p> <ul style="list-style-type: none"> <li>• plan and carry out a research project</li> <li>• collect data and analyse them</li> <li>• present results in a structured report</li> </ul> <p>Students get prepared for writing the more comprehensive report of the module M16 Master's Thesis.</p>	
7	<b>Prerequisites</b>	None	
8	<b>Integration in curriculum</b>	semester: 3	
9	<b>Module compatibility</b>	Pflichtmodul Master of Science Advanced Optical Technologies 20222	
10	<b>Method of examination</b>	Written assignment Report of about 15-25 pages	
11	<b>Grading procedure</b>	Written assignment (100%)	
12	<b>Module frequency</b>	Irregular	
13	<b>Workload in clock hours</b>	Contact hours: 0 h Independent study: 300 h	
14	<b>Module duration</b>	1 semester	
15	<b>Teaching and examination language</b>	english	
16	<b>Bibliography</b>	Depends on the subject of the report.	

# Optical Metrology

1	<b>Module name</b> 44960	<b>Thermophysikalische Eigenschaften von Arbeitsstoffen der Verfahrens- und Energietechnik</b> Thermophysical properties of working materials in process and energy engineering	<b>5 ECTS</b>
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	PD Dr. habil. Thomas Manfred Koller
5	<b>Contents</b>	<ul style="list-style-type: none"> <li>• Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik</li> <li>• Gleichgewichtseigenschaften zur Charakterisierung von Arbeitsstoffen, z.B. in Form der thermodynamischen Zustandseigenschaften und -größen Dichte, innere Energie, Enthalpie, Entropie, spezifische Wärmekapazität, Schallgeschwindigkeit, Brechungsindex, Oberflächen- und Grenzflächenspannung</li> <li>• Transporteigenschaften zur Charakterisierung des molekularen Masse-, Energie- und Impulstransportes, z.B. Viskosität, Diffusionskoeffizient, Soret-Koeffizient, Thermodiffusionskoeffizient, Wärme- und Temperaturleitfähigkeit</li> <li>• Anwendungsbezogene Stoffdatenrecherche in der wissenschaftlichen Literatur, Tabellenwerken und Datenbanken</li> <li>• Korrelationen und Vorhersagemethoden für Stoffeigenschaften</li> <li>• Methoden zur experimentellen Bestimmung und prozessbegleitenden Messung von Stoffdaten, insbesondere durch moderne laseroptische Techniken</li> <li>• Grundzüge der theoretischen Bestimmung von Stoffdaten mit Hilfe der molekularen Modellierung</li> <li>• Aufstellung von thermischen und kalorischen Zustandsgleichungen</li> </ul> <p>*Content*</p> <ul style="list-style-type: none"> <li>• The importance of thermophysical properties in process and energy engineering</li> <li>• Equilibrium properties for the characterization of working materials, e.g., in the form of thermodynamic properties of state and other equilibrium properties such as density, internal energy, enthalpy, entropy, specific heat capacity, sound speed, refractive index, surface or interfacial tension, etc.</li> <li>• Transport properties for the characterization of molecular transfer of mass, energy, and momentum, e.g. diffusion coefficients, Soret coefficient, thermal diffusion coefficient, thermal conductivity, thermal diffusivity, and viscosity</li> <li>• Use-oriented inquiry of thermophysical property data in scientific literature, table compilations, and databases</li> <li>• Correlation and prediction of thermophysical properties</li> </ul>

		<ul style="list-style-type: none"> <li>• Methods for experimental determination and in-process measurement of thermophysical properties, in particular by laser-optical techniques</li> <li>• Basics of the theoretical prediction of thermophysical properties by molecular modeling</li> <li>• Development of thermal and caloric equations of state</li> </ul>
6	<b>Learning objectives and skills</b>	<p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• sind mit der Bedeutung von Stoffdaten in der Verfahrens- und Energietechnik in Form von Gleichgewichts- und Transporteigenschaften vertraut,</li> <li>• verwenden verschiedene Bezugsquellen für Stoffeigenschaften (Recherche in wissenschaftlicher Literatur, Tabellenwerken und Datenbanken; Korrelationen und Vorhersagemethoden; theoretische und experimentelle Bestimmung) eigenständig und wählen diese bedarfsgerecht und abhängig vom resultierenden Nutzen und Aufwand aus,</li> <li>• kennen die Herangehensweisen zur Korrelation und Vorhersage von Stoffeigenschaften sowie zur Aufstellung von thermischen und kalorischen Zustandsgleichungen und übertragen diese Herangehensweisen auf andere Stoffe,</li> <li>• sind mit experimentellen Methoden zur Stoffdatenbestimmung vertraut, insbesondere mit laseroptischen Messtechniken,</li> <li>• verstehen die Grundzüge der molekularen Modellierung zur theoretischen Bestimmung von Stoffdaten und</li> <li>• wählen Arbeitsmedien mit definierten Stoffeigenschaften für eine optimierte Gestaltung von Verfahren und Prozessen der Energie- und Verfahrenstechnik aus.</li> </ul> <p>*Education objectives and competences*</p> <p>The students</p> <ul style="list-style-type: none"> <li>• are aware of the importance of thermophysical properties in process and energy engineering in the form of equilibrium and transport properties,</li> <li>• use various sources for thermophysical properties (scientific literature, table compilations, databases, correlations, predictions, theoretical and experimental determination) independently and select the respective sources in a use-oriented way considering the resulting effort and benefit,</li> <li>• know the approaches for the correlation and prediction of thermophysical properties as well as for developing equations of state, and are able to transfer these approaches to other systems,</li> <li>• are familiar with experimental methods for the determination of thermophysical properties, in particular with laser-optical methods,</li> <li>• understand the basics of the use of molecular modeling for the theoretical determination of thermophysical properties,</li> <li>• select working materials with defined thermophysical properties for an optimized design of processes in energy and process engineering.</li> </ul>

7	<b>Prerequisites</b>	Grundkenntnisse der Technischen Thermodynamik sowie der Wärme-, Stoff- und Impulsübertragung Basic knowledge on engineering thermodynamics as well as heat, mass, and momentum transfer
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Optical Material and Systems Master of Science Advanced Optical Technologies 20222 Optical Metrology Master of Science Advanced Optical Technologies 20222
10	<b>Method of examination</b>	Written or oral in der Regel mündliche Prüfung zum Stoff von Vorlesung und Übung, Klausur optional nur bei mehr als 20 Teilnehmenden, Prüfungsform wird innerhalb der ersten zwei Vorlesungswochen festgelegt
11	<b>Grading procedure</b>	Written or oral (100%)
12	<b>Module frequency</b>	Only in summer semester
13	<b>Resit examinations</b>	The exams of this moduls can only be resit once.
14	<b>Workload in clock hours</b>	Contact hours: 60 h Independent study: 90 h
15	<b>Module duration</b>	1 semester
16	<b>Teaching and examination language</b>	english

4	<b>Module coordinator</b>	Dr. Alberto Leonardi	
5	<b>Contents</b>	<p>The course aims to provide a comprehensive framework for investigation of chemical systems exploiting advanced photon and neutron scattering methods. Control of chemical and physical processes with atomic scale and fast time-resolution requires use of large-scale sources. Moreover, combination of numerical simulations with experiments is inevitable for designing of new materials and chemical processes. The objective of this course is for the student to learn: (i) what technologies are available for research and industry from international laboratories, (ii) how to access these resources, (iii) how numerical simulations can be used for data analysis.</p> <p><b>Part I: Theory (30%)</b></p> <p><b>Basics</b></p> <ul style="list-style-type: none"> <li>- Review of Materials crystal structure</li> <li>- X-ray – Matter interactions (absorption and elastic/inelastic scattering; Auger, etc.)</li> <li>- Scattering Theory (scattering by electron, atom, cell; scattering cross section; form factors)</li> </ul> <p><b>Commercial vs. Large Scale Sources</b></p> <ul style="list-style-type: none"> <li>- High energy X-ray and Neutrons (basic properties of X-rays vs. neutrons)</li> <li>- Synchrotron vs. X-ray free-electron-laser vs. neutron (radiation production)</li> <li>- Neutron - Matter interactions (scattering of neutrons; nuclear and magnetic scattering)</li> <li>- Access routes to Large Scale Facilities (project proposal, application process)</li> </ul> <p><b>Part II: Investigation Techniques (40%)</b></p> <p><b>Photon scattering for the study of chemical processes</b></p> <ul style="list-style-type: none"> <li>- Synchrotron techniques in catalytic science (XRPD, XPDF, XAFS)</li> <li>- Synchrotron techniques for Nanomaterials and Soft Matter Research (SAXS, XPCS)</li> <li>- In situ/operando synchrotron-based X-ray techniques (XRPD, XPDF, XAS, Imaging)</li> </ul> <p><b>Neutron scattering for the study of biological systems</b></p> <ul style="list-style-type: none"> <li>- Structure solution of macromolecular systems (SANS)</li> <li>- Macromolecular crystallography (NMX, Single Crystal Diffraction)</li> <li>- Neutron reflectometry (NR)</li> </ul> <p><b>Virtual Experiments</b></p> <ul style="list-style-type: none"> <li>- Data based simulation (e.g., Debye scattering equation)</li> <li>- Instrument based simulation (e.g., MC ray-tracing)</li> </ul>	

		<p><b>Part III: Applications (30%)</b></p> <p><b>Study of condensed matter systems - case study</b></p> <ul style="list-style-type: none"> <li>- Mechanism of Crystallization (and growth) of polymers</li> <li>- Spatial and temporal exploration of heterogeneous catalysts.</li> <li>- Study of electrode materials in electrochemical cells during operation (e.g., battery)</li> </ul> <p><b>Study of bio-organic systems - case study</b></p> <ul style="list-style-type: none"> <li>- Study of water systems, hydroxyl groups, hydronium ions, etc.</li> <li>- Study of domain mixing</li> <li>- Study of membrane protein structure</li> <li>- Study of hydration and protonation states</li> <li>- Studies of oxidized and reduced forms of the protein</li> </ul> <p>Note: the discussion of the subjects during the course may not reflect the sequential order in the outline due to practical reasons (as an example applications are luckily to be presented in direct relation to the corresponding techniques and not as an independent segment of the course).</p>
6	<b>Learning objectives and skills</b>	<p>Students will become familiar with technologies available for industry and research applications at international laboratories, and discuss possibilities, limitations and future developments.</p> <p>Students who successfully participate in this module can:</p> <ul style="list-style-type: none"> <li>- Understand how scattering techniques are used for characterization of molecular systems, and understand the different type of source (e.g., laboratory X-ray, Synchrotron, Neutron and Neutron TOF)</li> <li>- Apply simulations to support the analysis of neutron and synchrotron scattering data</li> <li>- Identify investigation method and instrument by assessment of material and technique properties.</li> <li>- Collect information on topics of current interest and present the results to the course members orally or in writing</li> <li>- Explain how to access international laboratory resources, and how to support their experimental project proposals.</li> </ul>
7	<b>Prerequisites</b>	Fundamentals of general physics

# Optical Material Processing

1	<b>Module name</b> 42130	<b>Advanced Laser</b>	<b>5 ECTS</b>
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr. Nicolas Joly	
5	<b>Contents</b>	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>	
6	<b>Learning objectives and skills</b>	<p>Students</p> <ul style="list-style-type: none"> <li>• Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses</li> <li>• Estimate the duration of a laser pulse and adapt the technique to the level of precision required</li> <li>• Understand the design of laser cavities</li> </ul>	
7	<b>Prerequisites</b>	None

2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Michael Schmidt
5	<b>Contents</b>	The targeted audience is master level students who are interested in expanding their theoretical and practical knowledge in the field of solid state laser engineering. Introduction to physical phenomena used in development of modern solid state lasers Practical approaches used in design of solid state lasers Introduction to modeling and simulation of the lasing process Modeling of basic solid state laser performance using a commercial software package Practical familiarization with various optical, opto-mechanical, and opto-electrical components used in solid state laser
6	<b>Learning objectives and skills</b>	The students gain the following competences: Setting up basic modeling of a solid state laser using ASLD software Be able to apply modeling for evaluation of performance of a basic laser system Apply basic optimization of the laser system model Identification of an appropriate laser system for a given application Performing basic characterization of laser beam output parameters Enhanced understanding of the laser physics Familiarization with modern design approaches used in solid state laser engineering Improved understanding of linear and nonlinear effects relevant for linear and nonlinear laser beam propagation;
7	<b>Prerequisites</b>	None

3	Lecturers	Prof. Dr. Peter Hoffmann	

4	<b>Module coordinator</b>	Prof. Dr. Peter Hoffmann
5	<b>Contents</b>	<ul style="list-style-type: none"> <li>• Einführung: Weltmarkt für Lasersysteme, Strahlquellen und deren Anwendung in der Materialbearbeitung</li> <li>• Grundlagen zur Ausbreitung und Fokussierung von Laserstrahlung</li> <li>• CO<sub>2</sub>-Lasieranlagen: Strahlerzeugung, Bauformen für Strahlquellen, Strahlführung und formung, Anlagenbeispiele, Anwendungen</li> <li>• Festkörper-Lasieranlagen: Strahlerzeugung, Bauformen, Strahlführung über Lichtleitkabel, Strahlformung, Anlagenbeispiele, Anwendungen</li> <li>• Hochleistungsdioden-Lasieranlagen: Strahlerzeugung, Strahlführung und formung, Anlagenbeispiele, Anwendungen</li> <li>• Neuere Entwicklungen bei Strahlquellen und Laseranlage</li> <li>• Introduction: Global Market for Laser Systems, Beam Sources and their application in material processing</li> <li>• Fundamentals of Propagation and Focussing of laser radiation</li> <li>• CO<sub>2</sub>-Laser Systems: Beam Generation, design of beam sources, beam guidance and shaping, examples of systems, Applications</li> <li>• Solid-State-Laser Systems: Beam Generation, design, beam guidance via light conducting cable, beam shaping, examples of systems, Applications</li> <li>• High-Power-Diode-Laser Systems: Beam Generation, beam guidance and shaping, examples of systems, Applications</li> <li>• Novel developments in beam sources and Laser Systems</li> </ul>
6	<b>Learning objectives and skills</b>	Die Studierenden können den Weltmarkt für Lasersysteme, Strahlquellen und deren Anwendung in der Materialbearbeitung korrekt beschreiben. Die Grundlagen zur Ausbreitung und Fokussierung von Laserstrahlung werden so weit beherrscht, dass die Lernenden im Rahmen der geometrischen Optik überschlagsweise die Auslegung von Anlagen berechnen können. Bauformen für CO <sub>2</sub> -Strahlquellen Strahlführung und formung können die Lernenden skizzieren. Sie erläutern sicher die Anwendungen für Anlagen mit Festkörperlasern, deren Bauformen, die Strahlerzeugung, -führung über Lichtleitkabel und formung. Das Prinzip der Strahlerzeugung in Hochleistungsdiodenlasern können lernende darstellen, ebenso wie dafür geeignete Systeme

		zur Strahlführung, -formung und Anwendungen mit dazugehörigen Anlagenbeispielen. Die Lernenden können über neueste Entwicklungen bei Strahlquellen und Laseranlagen berichten.

1	<b>Module name</b> 47650	<b>Medizintechnische Anwendungen der Photonik</b> Photonics for medical applications	<b>5 ECTS</b>
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Bernhard Schmauß
5	<b>Contents</b>	<p>Das Modul behandelt spezialisiert medizintechnische Anwendungen der Photonik.</p> <p>Zunächst wird die Lichtausbreitung in biologischem Gewebe beschrieben und diskutiert. Ein weiterer Abschnitt behandelt die Wechselwirkung zwischen Licht und Gewebe, wobei die einzelnen Wechselwirkungsmechanismen auch an Beispielen der medizintechnischen Praxis vertieft werden. Hier sind stellvertretend zu nennen: Photodynamische Therapie, Photokoagulation, Laser-in-situ-Keratomiileusis (LASIK). Ein weiterer Themenschwerpunkt ist die Diskussion entsprechender diagnostische Verfahren. Hier wird beispielsweise aus spektroskopische Verfahren und auf Diagnoseverfahren die auf Fluoreszenz basieren detailliert eingegangen. Entsprechende Konzepte von Diagnosegeräten wie Endoskope, konfokale Mikroskope, Optische Kohärenztomographie (OCT), faserbasierte Sensoren und Biochipsensoren werden in einem weiteren Abschnitt vertieft. Ein aktueller Forschungsbezug wird im letzten Kapitel, das photonische Systeme in der Ophthalmologie behandelt, hergestellt.</p> <p>Die Lehrveranstaltung des Moduls teilt sich auf in einen Vorlesungsteil sowie einen Übungsteil, in dem die Studierenden durch eigene Beiträge (angeleitete Literaturrecherche, Kurzvorträge und Praxisprojekte) die Inhalte der Vorlesung vertiefen.</p>
6	<b>Learning objectives and skills</b>	<p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• besitzen spezialisiertes und vertieftes Wissen der medizintechnische Anwendungen der Photonik, insbesondere der im Inhalt genannten Themengebiete.</li> <li>• können technische und wissenschaftliche Anwendungen der Photonik diskutieren, beurteilen und vergleichen.</li> <li>• sind in der Lage, ihre theoretischen Kenntnisse zur Photonik und Lasertechnik im Bereich der Medizintechnik vergleichend einzusetzen und so neue Verfahren und Konzepte zu entwickeln und auszuarbeiten.</li> <li>• können eigenständige Ideen und Konzepte zur Lösung wissenschaftlicher und technischer Probleme der Medizintechnik mit photonischen Systemen entwickeln.</li> </ul>
7	<b>Prerequisites</b>	<p>*Voraussetzungen:*</p> <ul style="list-style-type: none"> <li>• Für Studenten im Master-Studium.</li> </ul>

5	<b>Contents</b>	<p>In der Vorlesung werden fortgeschrittene Techniken der Magnetresonanztomographie (MRT) erklärt. Vorausgesetzt werden Kenntnisse über Grundlagen des Gebietes, wie sie z.B. in der Vorlesung Magnetic resonance imaging 1" behandelt werden (Blochgleichungen, T1- und T2-Wichtung, Schichtselektion, k-Raum-Kodierung). U.a. folgende Themen werden behandelt: Echoplanare Bildgebung; Bildgebung des Flusses, der Perfusion, der Diffusion, der magnetischen Suszeptibilität; funktionelle MRT; Ultrahochfeld-MRT; CEST-Bildgebung; MRT-Technik; Beschleunigungsverfahren, z.B. parallele Bildgebung; Angiographie; Bewegungskompensation.</p> <p>The lecture covers advanced topics in magnetic resonance imaging (MRI). Knowledge about the basic principles of MRI are required as they are covered in the lecture Magnetic Resonance Imaging 1" (Bloch equations, T1 and T2 weighting, slice selection, k-space encoding). I.a. the following topics will be treated: echo planar imaging; imaging of flow, perfusion, diffusion, magnetic susceptibility; functional MRI; ultrahigh field MRI; chemical exchange saturation transfer imaging; MRI technique; acceleration methods, e.g. parallel imaging; angiography; motion compensation.</p>
6	<b>Learning objectives and skills</b>	<p>The participants</p> <ul style="list-style-type: none"> <li>• understand the principles, properties and limits of advanced MRI techniques</li> <li>• develop the ability to adapt basic principles of MRI to advanced MRI techniques</li> <li>• are able to explain MRI techniques, algorithms and concepts of the lecture to other engineers.</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Frederik Bernd Laun Prof. Dr.-Ing. Andreas Maier
5	<b>Contents</b>	In this module, the physical and technical basics of MRI are taught in detail. The principles of data acquisition are explained and various examples are shown. Imperfections in the data acquisition lead to image artifacts that cannot be avoided in all cases. Strategies for detecting and avoiding image artifacts are explained. One of the great strengths of MRI in medical diagnostics is the ability to acquire images with different contrasts. The origin of the frequently used T1 and T2 weighted image contrasts is discussed in detail. Various MRI sequence techniques are also discussed."
6	<b>Learning objectives and skills</b>	The participants <ul style="list-style-type: none"> <li>• understand the principles, properties and limits of basic MRI techniques</li> <li>• develop the ability to choose an appropriate basic MRI sequence and to set up the corresponding sequence parameters for a range of basic applications</li> <li>• are able to explain MRI techniques, algorithms and concepts of the lecture to other engineers.</li> </ul>

3	Lecturers	-	

4	<b>Module coordinator</b>	Prof. Dr.-Ing. Bernhard Schmauß	
5	<b>Contents</b>	<p>Optical data transmission systems are the enabler for our modern communication networks. Since the first systems have been installed, the transmission capacity as well as the transmission distance has been increased dramatically. The migration from point-to-point transmission systems to complex optical networks is still in progress. The fast evolution of optical transmission technology is stimulated by innovations in the field of the system key components. The lectures concentrate on the physical effects and properties of key components like semiconductor lasers, optical modulators, optical fibers, optical amplifiers and detector diodes. Especially also the nonlinear effects of the transmission fiber are discussed. The main focus is on the effects and characteristics which are important to achieve a certain system performance. The influence of component parameters on system performance is presented in examples related to installed systems and systems that are actually in development. The exercises partly use a numerical simulation tool to analyze the component influence on system performance.</p>	
6	<b>Learning objectives and skills</b>	<p>Students</p> <ul style="list-style-type: none"> <li>• Understand structure and operation of components of optical communication systems</li> <li>• Rate the optical properties of components and evaluate the influence of operational parameters on system performance</li> <li>• Are able to analyze the influence of linear and nonlinear fiber effects on optical signals and system performance</li> <li>• Can make use of system simulation tools to engineer optical links</li> </ul>	
7	<b>Prerequisites</b>	<p>Recommended prior knowledge:</p> <ul style="list-style-type: none"> <li>• Semiconductor physics</li> <li>• Ray optics</li> <li>• Photonics</li> </ul>

5	<b>Contents</b>	<p>Please check StudOn for <b>registration and further information</b>: <a href="#">Link to StudOn-Entry</a></p> <p>Nowadays, <b>microcontrollers are the centerpieces of electronics</b> in almost any device, including washing machines, vending machines, several parts of any car and, increasingly, in smart home applications. With processor, memory and peripherals in one chip, they represent a <b>full-fledged computer in miniature</b>, and some of them can be bought for just a few cents. This is why these controllers are very relevant for scientists as well. Specially in research laboratories, <b>individual and quick solutions</b> for controlling mechanics and devices for data logging are highly desired.</p> <p>A very suitable introduction to working with microcontrollers is the <b>Arduino platform</b>. With standardized hardware boards and its own development environment based on the programming language C, the main focus of Arduino is on the <b>rapid realization of new and individual projects</b>. Numerous code libraries and compatible hardware extensions such as WIFI boards, SD card slots, various sensors, smartphone interaction and much more enable <b>complex projects even for beginners</b>.</p> <p>The scope of the <b>two-week course</b> “Arduino hard- and software for lab applications and beyond” reaches from the understanding of basic hardware components and electronics to the implementation of a multitude of libraries and modules. In addition to theoretical lectures, each group of two to three students will <b>work on hard- and software every day</b>. In the <b>last few days</b> of the course, the students apply their knowledge in an <b>own project of their choice</b>. Thereby, first ideas to lab automation can be implemented.</p>	
6	<b>Learning objectives and skills</b>	<p>The students gain sound qualification in designing and realizing complex hard- and software projects using microcontrollers based on Arduino, including:</p> <ul style="list-style-type: none"> <li>• Basics of electronics and microcontrollers</li> <li>• Communication of microcontrollers</li> <li>• Analog and digital signals</li> <li>• Finite-state machine</li> <li>• Sensors, modules, shields</li> <li>• Software libraries</li> <li>• Displays</li> </ul>	

		<ul style="list-style-type: none"> <li>• Smartphone connection</li> </ul>
7	<b>Prerequisites</b>	Most important: Enthusiasm and curiosity about the topic Advantageous, but not mandatory: First experience in programming

5	<b>Contents</b>	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>	
6	<b>Learning objectives and skills</b>	<p>Students</p> <ul style="list-style-type: none"> <li>• Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses</li> <li>• Estimate the duration of a laser pulse and adapt the technique to the level of precision required</li> <li>• Understand the design of laser cavities</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Christoph Brabec Prof. Dr. Wolfgang Heiß	
5	<b>Contents</b>	<b>Lecture / Exercise / Lab work</b> The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.	
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed.</li> <li>Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.</li> </ul>	
7	<b>Prerequisites</b>	Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, or comparable

5	<b>Contents</b>	<p>Glass formulation using project management: Intensive exercise of 6 half days at the end of the semester. The teaching follows an "on time approach. After presentation of the case study, an introduction to the project management is given. Analytical tools are given to the students than can use them directly on the case study. The project is then defined through brainstorming followed by Solution analysis and quotation. The rules for scheduling, monitoring and controlling a project are introduced before the case study is started to be solved. An emphasis is given on reporting by quick presentation at the end of each half day by the project team. In conclusion a last time is taken to analyze the personal issues encounter during these six half days. That help the students to have a pragmatic thinking about what could have been a better project team and the need of a leader.</p> <p>Glass and Ceramic for Energy-technology:</p> <ul style="list-style-type: none"> <li>• Materials and energy</li> <li>• Solar Energy</li> <li>• Solar Thermal</li> <li>• Photovoltaic Energy</li> <li>• Insulation</li> <li>• Wind Energy</li> <li>• Nuclear waste glass storage</li> <li>• Energy in glass processing</li> <li>• Fuel Cell and Ion conductivity</li> <li>• Lighting LED and LASER REE technology</li> </ul>	
6	<b>Learning objectives and skills</b>	<p>Glass formulation using project management The student will</p> <ul style="list-style-type: none"> <li>• Learn the different concept used in project management as well as its specific vocabulary</li> <li>• Practice the project management in a small team</li> <li>• Use the different tools of project management</li> <li>• Go from an application to the conception of a product</li> </ul> <p>Glass and Ceramic for Energy-technology The student will</p> <ul style="list-style-type: none"> <li>• Understand the global environmental issues related to the use of glasses for:</li> <li>• Nonrenewable energy sources</li> <li>• Renewable energy sources</li> <li>• Energy efficiency</li> <li>• Energy storage</li> </ul>	

		<ul style="list-style-type: none"> <li>• Know the improvement needed in the future</li> <li>• Look for solution by linking the expected performance to the glass properties</li> <li>• Be able to choose the good glass composition, production and shaping processes</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Christoph Brabec	
5	<b>Contents</b>	The lecture will introduce to the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies of today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture and exercises.	
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed.</li> <li>Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.</li> </ul>

5	<b>Contents</b>	This lecture discusses important algorithms from the field of computer vision. The emphasis lies on 3-D vision algorithms, covering the geometric foundations of computer vision, and central algorithms such as stereo vision, structure from motion, optical flow, and 3-D multiview reconstruction. Participants of this advanced course are expected to bring experience from prior lectures either from the field of pattern recognition or from the field of computer graphics.
6	<b>Learning objectives and skills</b>	<p>Die Vorlesung stellt eine Auswahl von Methoden aus dem Gebiet der Computer Vision vor, die in dem Feld eine zentrale Stellung einnehmen. In den Übungen implementieren und evaluieren die Studierenden selbständig diese Methoden. Die Studierenden arbeiten die ganze Zeit über an populären Computer Vision-Methoden wie zum Beispiel Stereosehen, optischer Fluss und 3D-Rekonstruktion aus mehreren Ansichten. Für diese Probleme</p> <ul style="list-style-type: none"> <li>• beschreiben die Studierenden perspektivische Projektion, Rotationen und verwandte geometrische Grundlagen,</li> <li>• erklären die Studierenden die behandelten Methoden,</li> <li>• diskutieren die Studierenden Vor- und Nachteile verschiedener Modalitäten zur Erfassung von 3D-Informationen,</li> <li>• implementieren die Studierenden einzeln und gemeinschaftlich in Kleingruppen Code,</li> <li>• entdecken die Studierenden optimale Vorgehensweisen in der Datenaufnahme,</li> <li>• erkunden und bewerten die Studierenden unterschiedliche Möglichkeiten für die Evaluation,</li> <li>• diskutieren und präsentieren die Gruppenarbeiter in Gruppen die Vor- und Nachteile ihrer Implementierungen,</li> <li>• diskutieren und reflektieren die Studierenden gesellschaftliche Auswirkungen von Anwendungen des 3D-Rechnersehens.</li> </ul> <p>The lecture introduces computer vision algorithms that are central to the field. In the exercises, participants autonomously implement and evaluate these algorithms. The participants work throughout the time on popular computer vision algorithms, like for example stereo vision, optical flow, and 3-D multiview reconstruction. For these problems, the participants</p> <ul style="list-style-type: none"> <li>• describe perspective projection, rotations, and related geometric foundations,</li> <li>• explain the presented methods,</li> <li>• discuss the advantages and disadvantages of different modalities for acquiring 3-D information,</li> </ul>

		<ul style="list-style-type: none"> <li>• implement individually and in small groups code,</li> <li>• discover best practices in data acquisition,</li> <li>• explore and rank different choices for evaluation,</li> <li>• discuss and present in groups the advantages and disadvantages of their implementations,</li> <li>• discuss and reflect the social impact of applications of computer vision algorithms.</li> </ul>

5	<b>Contents</b>	<p>*Contents:*</p> <p>The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.</p>	
6	<b>Learning objectives and skills</b>	<p>*Learning goals and competences:*</p> <p>Students</p> <ul style="list-style-type: none"> <li>• understand the origin of the computation potential of quantum computers</li> <li>• understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm</li> <li>• understand the working principle of quantum error correction and key error correcting codes</li> <li>• code quantum algorithms in a modern quantum programming language</li> <li>• are able to apply the learned methodology to example problems</li> </ul>

5	<b>Contents</b>	<p>How do humans perceive the visual world? How can we build computational models to mimic this human perception? And how can we validate those computational models? This course is designed as an introduction to enable you to build computational models for human visual perception. It will therefore provide an introduction into the human visual system building on the course on cognitive neuroscience for AI developers. You will learn how the human eye and brain process visual input and what we currently know about the ventral visual stream. We will look at computational models for all different levels of visual processing and discuss how well they measure behavioral data. This lecture is designed to be at the intersection of Computer Science (Computer Vision and Graphics) and Cognitive Neuroscience. After an initial introductory phase, you will in small teams (1-3 students) perform a project to build prototypes for computational models for visual processing, reproduce recent scientific results or experiment with existing models.</p> <p>In addition to the project phase we will read and discuss recent research papers studying potential computational models and investigate how we can evaluate computational models.</p> <p>Please sign up via studon</p>	
6	<b>Learning objectives and skills</b>	<p>By the end of this course, students will be able to</p> <ul style="list-style-type: none"> <li>• Describe the basic processing steps of visual input in the human brain</li> <li>• Build a computational model for a known processing step</li> <li>• Read recent papers in the discipline and design a follow-up experiment</li> <li>• Choose/design and conduct a small research project</li> <li>• Choose adequate methods to evaluate a computational model</li> <li>• Work in and manage projects</li> </ul>

5	<b>Contents</b>	<p><b>What is photonic machine learning and why does it exist?</b></p> <p>Artificial neural networks (ANNs) have emerged as a powerful tool, which are for example used to accelerate medical research and for language processing. The freedom and power gained through the complexity of ANNs comes with the cost of a computational intense model training, eventually leading to a high energy consumption. For instance, the training of the recently published and much discussed large-language model ChatGPT 4 cost more than 100 million dollars. A reason for those high cost of ANNs is the underlying computing hardware, which is based on a von Neumann architecture, which simplifies means the separation of memory and processing units. As consequence, researchers study more specific beyond von Neumann architectures specifically designed for machine learning and deep learning applications.</p> <p>One possible solution to overcome the current limitations, could be the transfer of electrical ANNs into the optical domain. The resulting optical neural networks (ONNs) have attracted great interest over the last decades due to their promises of high processing speed, broad bandwidth, and low dissipative losses. Especially the collapse of many computational steps into a single process, which is natural in most ONNs, strongly increases the computational efficiency. Thus, ONNs are considered to path the way towards energy efficient and highly parallel optical circuits, which will have a significant impact on the performance and capabilities of future artificial neural networks. Multiple publications have demonstrated the capabilities of ONNs already.</p> <p><b>What are we going to discuss?</b></p> <p>The aim of the seminar is to give the audience an overview of the photonic machine learning community. How detailed this overview is, of course, depends on the number of participants. In general, we would select the topics from the following categories:</p>

		<ul style="list-style-type: none"> <li>- Optical fully-connected feedforward neural networks</li> <li>- Optical reservoir computing and other extreme learning machines</li> <li>- Photonic neural networks for image classification</li> <li>- Photonic neural networks for language classification, e.g., optical transformers</li> <li>- Limits of photonic neural networks and approaches beyond photonics</li> </ul>
6	<b>Learning objectives and skills</b>	<p><b>Goal of the seminar</b></p> <ul style="list-style-type: none"> <li>• Overview of cutting-edge science   Participants are exposed to recent developments in photonic machine learning and gain an overview about it.</li> <li>• Presenting science   Participants are supported in developing a comprehensive and engaging narrative for presentations</li> <li>• Extracting information   Participants will learn to extract relevant information from research papers in preparation for their literature review for their master's thesis.</li> <li>• Organization of information   Participants learn to collect, organize and process information from scientific papers</li> </ul>
7	<b>Prerequisites</b>	<p><b>I don't have background in machine learning, can I still participate?</b></p> <p>We do not expect a deep background in machine learning, however, expect a curious and proactive mentality to explore and learn new and unknown concepts.</p>
8	<b>Integration in curriculum</b>	semester: 1
9	<b>Module compatibility</b>	Computational Optics Master of Science Advanced Optical Technologies 20222
10	<b>Method of examination</b>	<p>Seminar achievement (45 minutes)</p> <p>This seminar explores recent developments in the field of photonic machine learning. Participants will present their topic in a seminar talk (30min) and have a discussion (15-30min) with the audience.</p>
11	<b>Grading procedure</b>	Seminar achievement (100%)

4	<b>Module coordinator</b>	Prof. Dr. Nicolas Joly	
5	<b>Contents</b>	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>	
6	<b>Learning objectives and skills</b>	<p>Students</p> <ul style="list-style-type: none"> <li>• Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses</li> <li>• Estimate the duration of a laser pulse and adapt the technique to the level of precision required</li> <li>• Understand the design of laser cavities</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Maria Chekhova	
5	<b>Contents</b>	<b>Contents:</b> 1. Basic concepts of statistical optics 2. Spatial and temporal coherence. Coherent modes, photon number per mode 3. Intensity fluctuations and Hanbury Brown and Twiss experiment 4. Interaction between atom and light (semiclassical description) 5. Quantization of the electromagnetic field 6. Quantum operators and quantum states 7. Heisenberg and Schrödinger pictures 8. Polarization in quantum optics 9. Nonlinear optical effects for producing nonclassical light 10. Parametric down-conversion and four-wave mixing, biphotons, squeezed light 11. Single-photon states and single-photon emitters 12. Entanglement and Bells inequality violation	
6	<b>Learning objectives and skills</b>	<b>Learning goals and competences:</b> Students <ul style="list-style-type: none"> <li>• explain the relevant topics of the lecture</li> <li>• apply the methods to specific examples</li> </ul>

4	<b>Module coordinator</b>	Prof. Dr. Michael Hartmann	
5	<b>Contents</b>	<p>*Contents:*</p> <p>The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.</p>	
6	<b>Learning objectives and skills</b>	<p>*Learning goals and competences:*</p> <p>Students</p> <ul style="list-style-type: none"> <li>• understand the origin of the computation potential of quantum computers</li> <li>• understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm</li> <li>• understand the working principle of quantum error correction and key error correcting codes</li> <li>• code quantum algorithms in a modern quantum programming language</li> <li>• are able to apply the learned methodology to example problems</li> </ul>

5	<b>Contents</b>	<p>Das Modul hat zum Ziel, die Studierenden mit dem prinzipiellen Aufbau eines Mustererkennungssystems vertraut zu machen. Es werden die einzelnen Schritte von der Aufnahme der Daten bis hin zur Klassifikation von Mustern erläutert. Das Modul beginnt dabei mit einer kurzen Einführung, bei der auch die verwendete Nomenklatur eingeführt wird. Die Analog-Digital-Wandlung wird vorgestellt, wobei der Schwerpunkt auf deren Auswirkungen auf die weitere Signalanalyse liegt. Im Anschluss werden gebräuchliche Methoden der Vorverarbeitung beschrieben. Ein wesentlicher Bestandteil eines Mustererkennungssystems ist die Merkmalsextraktion. Verschiedene Ansätze zur Merkmalsberechnung/-transformation werden gezeigt, darunter Momente, Hauptkomponentenanalyse und Lineare Diskriminanzanalyse. Darüber hinaus werden Möglichkeiten vorgestellt, Merkmalsrepräsentationen direkt aus den Daten zu lernen. Das Modul schließt mit einer Einführung in die maschinelle Klassifikation. In diesem Kontext wird der Bayes- und der Gauss-Klassifikator besprochen.</p> <p>The module aims to familiarize students with the basic structure of a pattern recognition system. The individual steps from the acquisition of data to the classification of patterns are explained. The module starts with a short introduction, which also introduces the used nomenclature. Analog-to-digital conversion is introduced, with emphasis on its impact on further signal analysis. Common methods of preprocessing are then described. An essential component of a pattern recognition system is feature extraction. Various approaches to feature computation/ transformation are demonstrated, including moments, principal component analysis, and linear discriminant analysis. In addition, ways to learn feature representations directly from the data are presented. The module concludes with an introduction to machine classification. In this context, the Bayes and Gauss classifiers are discussed.</p> <p>T</p>	
6	<b>Learning objectives and skills</b>	<p>Die Studierenden</p> <ul style="list-style-type: none"> <li>• erklären die Stufen eines allgemeinen Mustererkennungssystems</li> <li>• verstehen Abtastung, das Abtasttheorem und Quantisierung</li> <li>• verstehen und implementieren Histogrammequalisierung und -dehnung</li> <li>• vergleichen verschiedene Schwellwertmethoden</li> <li>• verstehen lineare, verschiebungsinvariante Filter und Faltung</li> </ul>	

		<ul style="list-style-type: none"> <li>• wenden verschiedene Tief- und Hochpassfilter sowie nichtlineare Filter an</li> <li>• wenden verschiedene Normierungsmethoden an</li> <li>• verstehen den Fluch der Dimensionalität</li> <li>• erklären verschiedene heuristische Merkmalsberechnungsmethoden, z.B. Projektion auf einen orthogonalen Basisraum, geometrische Momente, Merkmale</li> <li>• basierend auf Filterung</li> <li>• verstehen analytische Merkmalsberechnungsmethoden, z.B. Hauptkomponentenanalyse, Lineare Diskriminanzanalyse</li> <li>• verstehen die Basis von Repräsentationslernen</li> <li>• erläutern die Grundlagen der statistischen Klassifikation (Bayes-Klassifikator)</li> <li>• benutzen die Programmiersprache Python, um die vorgestellten Verfahren der Mustererkennung anzuwenden</li> <li>• lernen praktische Anwendungen kennen und wenden die vorgestellten Algorithmen auf konkrete Probleme an</li> </ul> <p>The students</p> <ul style="list-style-type: none"> <li>• explain the stages of a general pattern recognition system</li> <li>• understand sampling, the sampling theorem, and quantization</li> <li>• understand and implement histogram equalization and expansion</li> <li>• compare different thresholding methods</li> <li>• understand linear, shift invariant filters and convolution</li> <li>• apply various low-pass, high-pass, and nonlinear filters</li> <li>• apply different normalization methods</li> <li>• understand the curse of dimensionality</li> <li>• explain different heuristic feature calculation methods, e.g. projection on an orthogonal base space, geometric moments, features based on filtering</li> <li>• understand analytical feature computation methods, e.g. principal component analysis, linear discriminant analysis</li> <li>• understand the basis of representation learning</li> <li>• explain the basics of statistical classification (Bayes classifier)</li> <li>• use the programming language Python to apply the presented pattern recognition methods</li> <li>• learn practical applications and apply the presented algorithms to concrete problems</li> </ul>
7	<b>Prerequisites</b>	<p>Ein Mustererkennungssystem besteht aus den folgenden Stufen: Aufnahme von Sensordaten, Vorverarbeitung, Merkmalsextraktion und maschinelle Klassifikation. Dieses Modul beschäftigt sich in erster Linie mit den ersten drei Stufen und schafft damit die Grundlage für weiterführende Module (Pattern Recognition und Pattern Analysis).</p> <p>A pattern recognition system consists of the following stages: Sensor Data Acquisition, Preprocessing, Feature Extraction, and Machine Classification. This module primarily deals with the first three stages and</p>

		thus creates the basis for more advanced modules (Pattern Recognition and Pattern Analysis).

5	<b>Contents</b>	<p>The lectures provide an overview of the most important methods for the statistical evaluation of measured data. It lays the foundation for bachelor and master theses in experimental physics. In the first part of the lectures we will deal with the basics of statistics and probability theory. The second part of the lectures provides an introduction to measurement error and error calculation, parameter estimates and confidence intervals. For some of the exercises we will use computer (python language), which will be useful for the data analysis in the context of a Bachelor / Master thesis.</p> <p>The topics will include:</p> <p>Part I. Probability and statistics</p> <ul style="list-style-type: none"> <li>• Introduction to statistics and probability theory</li> <li>• Special distributions: Gaussian, Poisson, Multinomial</li> <li>• Parameter estimators of the distribution (mean, variance, bias etc.)</li> <li>• Multi-dimensional distributions</li> <li>• Random sampling</li> </ul> <p>Part II. Statistical interpretation of measurements</p> <ul style="list-style-type: none"> <li>• Least squared method</li> <li>• Chi2 fitting</li> <li>• Maximal likelihood</li> <li>• Bayesian statistics</li> <li>• Estimation of confidence intervals</li> <li>• Binned and unbinned analysis</li> </ul>
6	<b>Learning objectives and skills</b>	<p>Students</p> <ul style="list-style-type: none"> <li>• understand the basic concepts of probability and statistics</li> <li>• gain an understanding of the relevance of statistics for experimental data</li> <li>• learn how to statistically interpret data</li> <li>• understand how to chose the relevant statistical method</li> </ul>
7	<b>Prerequisites</b>	<p>To successfully follow this lecture basic knowledge of Python is advantageous. Alternatively, participants should be willing to learn how to program alongside this class.</p> <p>It is recommended to first complete "Datenverarbeitung in der Physik (DV)".</p>

3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	<b>Module coordinator</b>	Prof. Dr. Florian Marquardt
5	<b>Contents</b>	<p>This is a course introducing modern techniques of machine learning, especially deep neural networks, to an audience of physicists. Neural networks can be trained to perform diverse challenging tasks, including image recognition and natural language processing, just by training them on many examples. Neural networks have recently achieved spectacular successes, with their performance often surpassing humans. They are now also being considered more and more for applications in physics, ranging from predictions of material properties to analyzing phase transitions. We will cover the basics of neural networks, convolutional networks, autoencoders, restricted Boltzmann machines, and recurrent neural networks, as well as the recently emerging applications in physics. Prerequisites: almost none, except for matrix multiplication and the chain rule.</p>
6	<b>Learning objectives and skills</b>	<ul style="list-style-type: none"> <li>• explain the relevant topics of the lecture</li> <li>• apply methods to specific examples</li> </ul>

- Introduction to non-linear optics: Introduction to quantum optics, Hanbury-Brown-Twiss experiment, quantum nature of light, photon correlations, photon statistics, examples of non-classical light, bunching und antibunching of photons, resonance fluorescence

### **Course Advanced Experimental Physics: Particla and Astroparticle Physics (EV-B)**

- Introduction: Interactions and exchange bosons, Feynman diagrams; relativistic kinematics with four- vectors
- Covariant description of spin-less particles: Free particles, spatial probability density, charge current density, equation of continuity; Klein-Gordon equation: Solutions for free particles, energy eigenvalues, interpretation by Feynman and Stückelberg; scattering on a static potential: Perturbative approach, transition matrix element, Fermi's Golden Rule
- Electrodynamics of spin-1/2 particles: Maxwell equations in covariant notation; Dirac equation (free particles, gamma matrices, spin, anti-particles, helicity, charge current density, equation of continuity); electron- muon scattering: Current-current interaction, photon propagator, Feynman rules, helicity conservation, spin averaging (without explicit calculation), differential cross section; electron-positron annihilation to muons or quarks, hadron/muon ratio R; decay width and its relation to matrix element and phase space factor; higher orders: Anomalous magnetic moment (g-2), charge renormalisation, running coupling constant
- Weak interactions: Charged current: (V-A) structure and parity violation, propagator, Fermi constant, quark mixing: Cabibbo angle, CKM matrix, its complex phase and CP violation, direct and indirect CP violation; massive neutrinos; Oscillations, PMNS matrix, oscillation phenomenology of solar, atmospheric and reactor neutrinos
- Neutral currents and electroweak unification: Weak isospin and hypercharge,  $SU(2) \times U(1)$ ; electroweak coupling: Weinberg angle, Z- fermion-couplings
- Gauge theories and Higgs mechanism: Euler-Lagrange equation, global gauge invariance and current conservation: local gauge invariance and QED: Mass and interaction terms, photon field, spontaneous  $U(1)$  symmetry breaking; Higgs mechanism for  $U(1)$ : Gauge freedom, Higgs mass and interaction terms, masses of  $U(1) \times SU(2)$  gauge bosons (without explicit derivation); Higgs coupling to Standard Model particles, Higgs production and decay

### **Course Advanced Experimental Physics: Solid State Physics (EV-C)**

- Crystal structures
- Structure determination
- Vibrational properties

		<ul style="list-style-type: none"> <li>• Electronic structure</li> <li>• Electronic transport</li> <li>• Dielectric and optical properties</li> <li>• Magnetism</li> <li>• Superconductivity</li> </ul>

5	<b>Contents</b>	<p>This lecture course will give an overview and sketch the basics of advanced modern methods of artificial intelligence and machine learning. It will describe how they are used in artificial scientific discovery, in physics and other fields. Artificial scientific discovery aims to automatize all aspects of the scientific process. We will discuss (and also implement, in the tutorials):</p> <ul style="list-style-type: none"> <li>• how to extract the essence of data (representation learning)</li> <li>• how to choose the best experiments to do (active learning / experimental design)</li> <li>• how to come up with scientific hypotheses automatically and how to rule them out</li> <li>• how to discover optimal strategies (reinforcement learning)</li> <li>• how to learn the statistics of observations and reproduce them (generative probabilistic modeling)</li> </ul> <p>The modern tools discussed will include transformers, diffusion models, and graph neural networks. In addition, we provide the basics of information science and statistics needed to understand these approaches.</p>
